

With Interica OneView, navigating your DELFI data environments has never been easier.

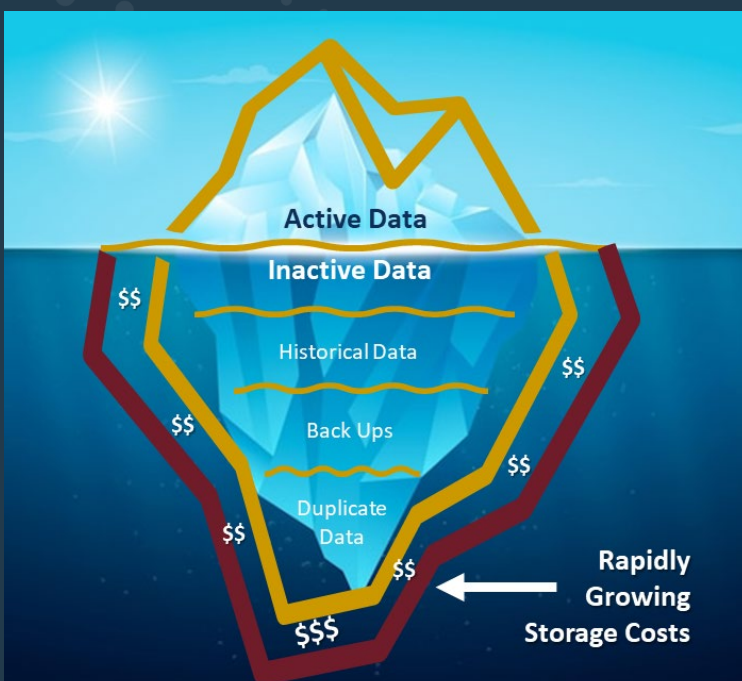

Now fully deployed in Petrotechnical Suite (PTS) on DELFI, Interica OneView (IOV) provides a 'single pane of glass' view over a company's petrotechnical application environment.

Users can quickly understand project content, ownership and quality and automate actions such as Archive. IOV harnesses the power of application connectors to extract rich metadata from live projects which can be viewed in conjunction with archived data.

What's included:

- IOV deployed in Petrotechnical suite on Delfi
- Setup to automatically Discover your petrotechnical project data
- Archive and retrieve to/from Azure Blob or AWS Object Storage
- Connectors for SLB applications
 - Petrel
 - Techlog
 - Eclipse
 - OSDU Seismic and Well
 - Studio (for Seismic)

Data Storage: The Iceberg Effect

- Discover and manage your petrotechnical suite (Petrel, Techlog) project landscape at scale.
- Reduce storage costs by archiving data out of the PTS and into blob or object storage.
- Migrate active and archive inactive datasets from your legacy environments

Improve efficient management & delivery of subsurface project data

Challenge

Our customer implemented a Subsurface Data Transformation Program (SDTP) with an objective to “...improve efficient management and delivery of subsurface technical project data”. This was to be implemented as a key component of an overall cloud migration programme.

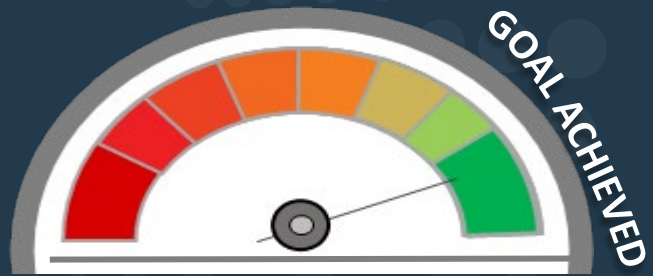

Solution

We successfully deployed Interica OneView in a hybrid mode, connecting to the customers key petrotechnical applications. Leveraging these connections, IOV’s ARBA module (Automated Rule Based Actions), Open API’s (for integration with their global GIS system) and AWS S3 Deep Glacier for robust and cost-effective long-term archival storage, Interica OneView managed and archived several petabytes of data.
